## Dismantling the Legs

Remove leg segments from the MegaGrip to adjust the overall height of the tripod. You can also loosen or tighten the screws to adjust the rigidity of the legs.

*Note: when removing one of the leg segments to shorten the MegaGrip, replace the bottommost foot with the rubber-tipped foot.*

1. Peel back and remove the rubber ring. **A**

2. Use the supplied Allen wrench to loosen and remove the screw. Be careful not to lose the screw or the nut. **B**

3. Remove the two clamp plates and the loose leg segment. **C**

4. If necessary, scrape out any debris from the clamp plates or leg segments.

5. To reassemble the legs, replace the two clamp plates and the leg segment.

6. One of the clamp plates has a circular socket. Insert the screw into the circular socket.

7. The other clamp plate has a hexagonal socket. Insert the nut in the hexagonal socket.

8. Use the Allen wrench to tighten the screw.

9. Replace the rubber ring around the clamp plates.

The Magnus MegaGrip comes with a carabiner and a nub that you can mount onto the male thread of the tripod, and then hang from a backpack or a utility belt.

# MegaGrip

Flexible Tripod

With three spider-like legs that bend 360° into virtually in shape or configuration, this unique tripod provides extra gripping power and easily clings to fences, trees, pipes, and more. Simply mount your photo device on the universal 1/4-20 screw, adjust the legs as necessary, and start snapping away!
